10 Reasons to Buy from KeyParts!

Hundreds of both classic & late-model distributors across the USA purchase their parts from KeyParts. Why?

- 1. Quality** - Parts unmatched by any other manufacturer in appearance and functionality.
- 2. Confidence** - Over 16 years of providing dependable service.
- 3. Trust** - New parts are vehicle-fit tested and proven before being factory produced.
- 4. Value** - Top quality parts and service balanced with highly competitive pricing.
- 5. Inventory** - More panels available than any other manufacturer and a huge inventory of parts.
- 6. Service** - Fast, efficient, reliable crosscheck and processing of orders.
- 7. Handling** - Packing orders with care and proficiency to assure safe arrival.
- 8. Shipping** - Orders shipped within 24hrs of receipt.
- 9. Convenience** - Mastercard/VISA/AMEX/Discover are all accepted for payment on orders.
- 10. Protection** - Easy RMA procedures when necessary.

Why STEEL GRADE and GAUGE are Important:

The Steel Making Process: All Steel is not Equal

The basic process of making steel requires mixing the raw materials of iron ore, coke, and limestone together in a blast furnace. The materials are superheated and melt together. A bonding process of the various materials occurs during the molten liquid stage. The impurities and waste byproducts called slag are separated and removed. The liquid material that remains is the basis of steel when cooled. Further processing options determine the type, grade, and gauge of the finished steel or steel alloy product.

Steel Grade Determination: Grade = Durability

Manufacturers do not all use the same type of alloy steel to make parts in our industry. The steel grade is indicative of performance. The higher the grade, the better performance and durability. Some of the factors that affect the performance of steel, and the parts manufactured from it are: hardness, grain size, alloy composition, and heat treating. **KeyParts** are made from one of the highest grades of steel in order to manufacture parts that will last and be more resistant to corrosion and rust. **KeyParts** uses steel that is less hard in order to form the parts more precisely, but also a dense steel that is far less porous and more corrosion/rust resistant.

Steel Gauge Factor: Gauge = Strength

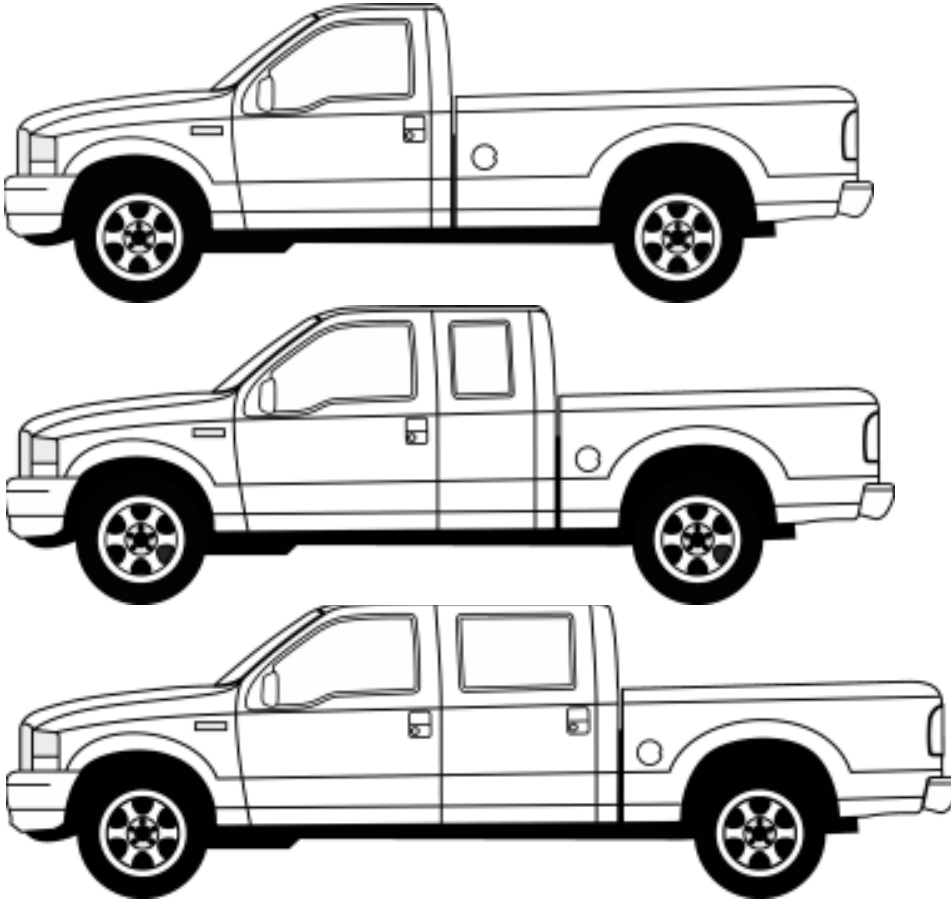

The number of ounces per square foot of area or the weight of the steel defines gauge. **“The lower the gauge number, the thicker the steel”**. This base definition applies to bare steel before any galvanizing, paint or other type of coating. Manufacturers that use sheet steel typically order the material to the minimum gauge acceptable to the customer and specify that “nominal” tolerances be used.

Nominal means that the customer could order the minimum 24 gauge material thickness (.0219”) with a standard plus or minus .003 inches tolerance for that gauge. The result is that even though the customer ordered a metal thickness within the 24-gauge range, the material received and subsequently processed and sold is in the 25-gauge range. In this case, the customer is truly selling a product that is 24 gauge in name only.

KeyParts orders material with “tight” tolerances to assure that the specified gauge be acquired and used for the parts we produce. The steel is also ordered with a thicker gauge to further maintain control since the theoretical thickness cannot be maintained 100% precisely in the steel forming process. **KeyParts** uses OEM or better gauges of steel which far exceeds the minimum gauge acceptable to the customer. The gauge of steel is important for strength. The thicker the gauge, the more resistant it is to pings, dents, bending, and stress. All of our parts are 19gauge or thicker.

*With **KeyParts**, customers can be sure that they receive a product that meets the strength and durability standards they are looking for in the parts that they buy.*

General Information: Vehicle Body Styles

The top truck doesn't have a backseat or room for storage. The middle truck shown has an elongated cab with storage space to fit equipment or a small passenger behind the front seat and has a latched door on the passenger side for access. The bottom truck has a full backseat for passengers with four door handle access.

LATE-MODEL TRUCK BODY STYLES

The following list specifies the names that major OEM's designate their different truck body styles (*the examples shown left are FORD*):

FORD

Regular Cab
Super Cab
Crew Cab

CHEVY

Standard Cab
Extended Cab
Crew Cab

DODGE

(Old Style) 94-02

Standard Cab
Club Cab
Quad Cab

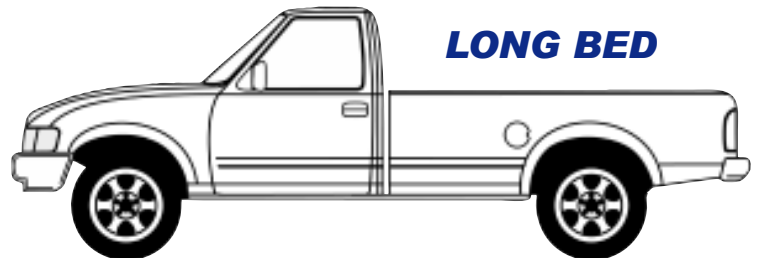

DODGE

(New Style) 02-ON

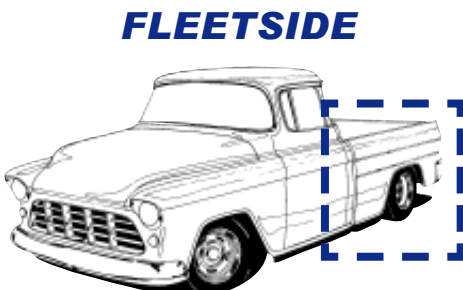

Standard Cab
Quad Cab

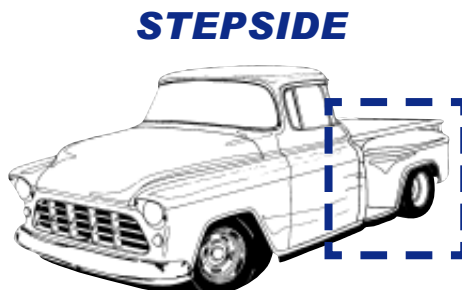

SHORT BED

LONG BED

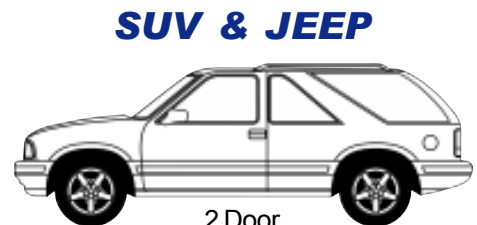

FLEETSIDE

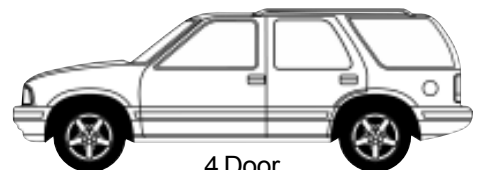

STEPSIDE

The BED is streamlined and straight along the body side contour as a complete bed-side with no indent and no step. The bed width is standard full size. The bed has a rear wheel house.

The BED is indented with a recessed step in front of the back wheel and a fender that protrudes out. The bed width is narrower than standard full size. It does not have a rear wheel house.

STEEL SHEETS

J LIP DOOR BOTTOMS

When To Use UNIVERSAL REPAIR PARTS:

You should use these steel Universal Parts for areas that do not require an entire new part replacement and for minor areas of rust. They can work well for small areas to patch such as those shown above. Flex Edge is efficient with curved areas. J-Lips are particularly useful for a partial door area repair.

However, make sure that the areas to be repaired do not have significant rust around them that can migrate over to a newly repaired area. Check behind and underneath the area that you need to repair. If you can see or feel additional spreading of rust, then you should consider replacing the entire area with the full high-quality KeyPart designed specifically for that repair job.

KeyParts Hoods add style to any truck!

PHOTO A) This shows a plain gray 2006 CHEVY Colorado Crew Cab with the OEM hood that came standard with the vehicle at the time of purchase.

PHOTO B) Shown here is the same vehicle with a KeyParts COWL Style hood added to the vehicle and replacing the OEM hood. As you can see, the fit is clean and well matched to the truck.

NOTE: The KeyParts hood has not yet been painted to match the truck color.

The "KeyParts" Advantage

KeyParts Research and Development

The KeyParts that are manufactured get determined through an intensive process. The process begins with obtaining an OEM Truck cab or bed, a body in the case of Vans and SUV's. A vehicle study is performed to not only determine where it is rusting, but where it will continue to rust as the area spreads over the lifetime of the Truck, Van or SUV. After the problem areas are identified, the vehicle section is reverse engineered and a part is carefully designed with critical dimensions. A physical part is then cut-out of the actual OEM vehicle as a visual reference for test-fitting and used to acquire a 3D scan image of the part. The image used with CAD (computer-aided design) will then be applied to the production of the die and tooling equipment to ensure the accuracy of part dimensions, body lines, and contours. Upon completion of production equipment, sample parts are produced and test-fitted onto actual vehicles for both appearance and proper fit. At this point, the test-fit process continues until an accurate part is assured whereby it will go into manufacturing production after a final series of cross-checks.

Remember, not all parts need to replace the entire OEM section. In many cases we offer several non-OEM options. For instance, on truck bedsides depending upon your need and the extent of the problem - you can purchase the entire OEM replica bedside or non-OEM full wheel arch section, partial wheel arch section, or just the front/rear bed sections. In defining the problem areas, we offer parts that replace an entire OEM section or simply offer a lower-cost solution to just the trouble areas.

To achieve a level of quality that is equal to or better than the OEM body section of the vehicle that is being repaired - we only use 19 gauge or higher steel for our panels. The highest grade steel available is used for our parts as well. Furthermore, our plants use "all-steel" dies and tooling which produces cleaner body features and enables us to use a thicker gauge of steel. Additionally, our chief parts designer has over 30 years of experience in the vehicle body parts field and has designed most of the high quality custom-formed parts we produce and sell today.

KeyParts State-of-the-Art Factory Technology

From AutoCAD design development to computer-driven robotic production equipment, the factories that produce our KeyParts use the latest advancements in technology to design, develop, and manufacture the finished product. Most of these facilities have been built within the last 5 years and long after the worldwide technology boom which allowed production plants to be constructed with technology in mind. New robotic equipment for stamping/tooling/finishing, laser guidance, and plasma-cutting provides for a level of stricter tolerances and accuracy. With these factory innovations, it enables us to use high-grade steel of heavier gauge than many other manufacturers. This all equates to making a superior quality part for our customers. ***Our catalog photos are "crystal" clear, because they don't have any flaws to hide! See how many other manufacturers offer the same visual references or part displays.***

Quality Assurance:

KeyParts are manufactured under the rigid guidelines of International ISO 9001 Standards in modern high-tech production plants.

Most other manufacturers don't follow these quality standards guidelines or use old technology.

Advantage: Top quality production process is maintained.

Engineering Design:

KeyParts stamping forms are engineered & produced to the precise specifications of the original part or design. Strict computer-checked interface tolerances are adhered to without exception.

Many others are manufactured to be simply "close-enough" using only human inspection requiring the end-user to make parts fit.

Advantage: Superior fitting parts with consistency maintained.

Die Stamping:

KeyParts are die-stamped to exactly match the characteristics such as body lines/definition of the original equipment manufacturer's (OEM) part. The presses and forms are continually monitored for stress, position, pressure, and accuracy at each stage. *Some other manufacturers don't practice these rigid procedures.*

Advantage: Makes installation accurate, quick & easy.

Steel Gauge:

KeyParts uses the highest gauge steel possible with each part. These meet or exceed the gauges of the OEM parts.

Alot of other manufacturers use lighter gauges of steel to save on costs but can cause installation issues.

Advantage: No buckling, warping, wrinkling, or stress lines.

Product Testing:

KeyParts are tried and tested on actual vehicles until both the "mechanical" and "visual" fit are correctly produced.

Some manufacturers claim to test directly on vehicles but merely perform visual tests or use photo references.

Advantage: No worries about how the part will actually fit or whether contour & body curves line up from a visual perspective.

Tooling:

KeyParts duplicate the OEM flanges, lips, and other connections to minimize installation problems. There are no rough or jagged edges on non-OEM parts. Necessary specs are laser measured.

Many other parts from different manufacturers require the end-user to deal with rough or jagged edges.

Advantage: No major installation or safety issues and virtually no hand-tooling work required.

Fitting:

KeyParts designs accurately fit the vehicle area of repair with no body fit adjustments necessary. No press brake formation is used.

The majority of others require some bending, forming, and/or manipulation of the part.

Advantage: No installation adjustments or hand-beating needed.

Overlapping:

KeyParts are made to not only cover the typical rust area but to extend beyond that area to insure a clean repair and allow enough overlapping metal to connect with the existing vehicle structure before welding.

Alot of other designs do not cover enough overlap allowing adjacent rust areas to migrate over to the repaired section with time.

Advantage: No concerns about impending rust migration.

Finishing:

PAINTED PARTS - KeyParts uses the latest Electro-Deposit Primer (EDP) finish process, subjecting the parts to a heavy coating of high quality black primer upon being thoroughly cleaned and prepped.

CHROMED PARTS - KeyParts uses a Triple Nickel chrome process which is the most proven available. It provides a durable finish with deep reflective properties.

Other manufacturers fail to clean the parts properly before applying primer or just leave the steel unprotected altogether.

Advantage: No primer flaking, no oil residue, and minimal scuffing of the surface required prior to installation.
